2019 Data

Two Analytics are shown here:

First, shows average concentration of particulate matter (PM2.5) by location and classified by risk category. With conc. of PM2.5 $\leq 15 \mu\text{g}/\text{m}^3$ being low risk, $\leq 35 \mu\text{g}/\text{m}^3$ being medium risk and $> 35 \mu\text{g}/\text{m}^3$ considered as high risk.

Second, shows Relative Uncertainty (RU) by location and classified into category. Higher value of RU indicates that conc. of PM2.5 varies very much in a year from the average conc. of that year. Categorized as RU $\leq 20\%$ as High Certainty, $\leq 40\%$ as Medium Certainty and $> 40\%$ as Low Certainty.

Avg . Concentration (in $\mu\text{g}/\text{m}^3$) by Location and Risk Category

Risk Category ● HIGH ● LOW ● MEDIUM

Relative Uncertainty (in %) by Location and Category

Category ● High Certainty ● Low Certainty ● Medium Certainty
